

Weapon and character effects

Standard Unity Asset Store license Copyright (c) 2026 Hovl Studio (Vladyslav Horobets)

When you purchase this asset, you get a license to use effects, icons with one UI animation, models, textures, scripts, shaders, materials and sounds based on the Unity Asset Store license.

Support email hovlstudio1@gmail.com

Using:

Add a prefab to the object you want to add the effect to and click the "**Apply mesh effect**" button.

Script info:

HS_MeshEffect automatically links a mesh (or skinned mesh) to particle systems and adjusts their emission to match the object's size.

What it does:

- Uses a specified `selectedObject` (or the parent object if none is assigned) as the source mesh.
- Detects whether the object contains a **MeshRenderer** or **SkinnedMeshRenderer**.

- Assigns that mesh to all Particle Systems under `particleEffects` so particles emit directly from the object's surface.
- Optionally injects a secondary material (`meshMaterial`) into the renderer to support mesh-based visual effects.
- Calculates the object's world-space bounds and scale to determine a size-based emission multiplier.
- Automatically scales `rateOverTime` of each Particle System so VFX density remains visually consistent across differently sized objects.
- Works with inactive particle systems and handles non-uniform object scaling.

Result:

You can reuse the same VFX prefab on any model, and the particles will correctly conform to the mesh shape and maintain proper emission density without manual retuning.
